The Cincinnati Center for Eosinophilic Disorders is conducting a research study to test whether losartan decreases the number of eosinophils in the esophagus of participants with active EoE, with or without a connective tissue disorder (CTD).

What

We are enrolling participants for a 4 month open label drug trial. This involves several visits to Cincinnati Children's, blood draws, biopsies taken from EGD, and having vitals taken.

How

Participation will take place at Cincinnati Children's, over the phone and through the mail.

Who

People with active EoE with or without a CTD

Contact

If you have questions or are interested in participating, contact Jonathan Kuhl at Jonathan.Kuhl@cchmc.org or 513-803-3078.
